Abstract (Basic): JP 8231706 A

In the mfr. of a polyoxytetraalkylene glycol or its ester by ring opening-polymerisation of a cyclic ether in the presence or absence of a carboxylic acid anhydride, a solid acid catalyst of a composite oxide contg. an element selected from (a) Ge, Sn, Pb, B, Ga, In, Cd, Cu, Fe, Mn Ni, Cr, Mo, Co, Ta, Hf, Yt La, Nb and Ce, and an element selectd from (b) Si, Al, Zr, Ti and Zn is used.

Pref. the (a) element is Sn, B, Ga In,Cu, Fe, Ni, Cr, Co, Ta, Hf La and/or Nb. The cyclic ether is tetrahydrofuran. The catalyst is obtd. from a catalytic precursor prepnd. by adding alkali to mixed soln. contg. an alkoxide of an (a) element and an alkoxide of oxide of a (b) element.

ADVANTAGE - The mfr. gives polyoxyalkylene glycols with a medium molecular wt. and a narrow molecular wt. distribution from cyclic ethers. The catalyst can easily be sepd. from the unreacted materials and the polymer prod. and can easily be regenerated. The reactor does not need to be of precious material because the catalyst is not a strong acid.
